This report, and information or advice which it contains, is provided by ExCAL solely for internal use and reliance by its Client in performance of ExCAL's duties and liabilities under its contract with the Client. Any advice, opinions, or recommendations within this report should be read and relied upon only in the context of the report as a whole. The advice and opinions in this report are based upon the information made available to ExCAL at the date of this report and on current UK standards, codes, technology and construction practices as at the date of this report. Following final delivery of this report to the Client, ExCAL will have no further obligation or duty to advise the Client on any matters, including development affecting the information or advice provided in this report. This report has been prepared by ExCAL in their professional capacity as Environmental Consultants. The contents of this report do not, in any way, purport to include any manner of legal advice or opinion. This report is prepared in accordance with the terms and conditions of ExCAL's contract with the Client. Regard should be had to those terms and conditions when considering and/or placing any reliance on this report. Should the Client wish to release this report to a Third Party for the party's reliance, ExCAL may, at its discretion, agree to such release provided that:

- ExCAL's written agreement is obtained prior to such release and,
- By release of the report to the Third Party, that Third Party does not acquire any rights, contractual or otherwise, whatsoever against ExCAL and ExCAL, accordingly, assume no duties, liabilities or obligations to that Third Party, and
- ExCAL accepts no responsibility for any loss or damage incurred by the Client or for any conflict of ExCAL's interests arising out of the Clients' release of this report to the Third Party.

1.0 INTRODUCTION

ExCAL Limited has been commissioned to undertake groundwater monitoring on behalf of Morganite Electrical Carbon in accordance with their Site Protection and Monitoring Program.

The groundwater monitoring commenced in October 2006 and this report provides the sampling methodology, record forms and results of monitoring to date. Sampling was undertaken in April 2010.

All laboratory analysis was undertaken by the UKAS accredited Chemtest Laboratories and Decus Research Laboratories.

2.0 GROUNDWATER MONITORING PROGRAMME

2.1 Introduction

This procedure provides guidance that is followed by all ExCAL staff when monitoring groundwater and taking samples.

2.2 Staff Responsibility

The project manager will ensure all personnel are proficient in groundwater sampling and are familiar with these procedures.

2.3 Site Equipment

The following site equipment is required to undertake groundwater monitoring: -

- Log Book
- Well Construction Details
- Site/monitoring well location Plan
- Dip Meter
- Bailers
- Decontamination Equipment
- Sampling Equipment (Bottles, Fixing Agents (if necessary) labels, chain of custody forms, icepacks).

2.4 Well Purging

Monitoring wells are always to be purged prior to sampling on each and every occasion. Purging involves the removal of 'stagnant' water that has been in contact with atmospheric gases and the well casing and screen materials. This contact can affect the water chemistry and oxygen can diffuse into the water and dissolved gases can volatilise or oxidise.

Organics may be adsorbed by the well casing and trace elements may also be leached from the well casing. Purging ensures a representative sample is obtained from the aquifer.

2.4.1 Purging Procedure

1. Dip water Level and Well Depth and Measure Internal Well Diameter;
2. Calculate Well Volume (50mm well: 0.5m = 1L and 35mm well: 1m = 1L);
3. Remove 3 x well volume using either dedicated bailer or submersible pump positioned at the TOP of the water column^{*1};

(*¹If the water level is above the screened area and the pump intake is within the screened area, it is possible for a section of stagnant water to remain within the well. It is good practice, in such cases, to commence pumping at the top of the water table and slowly lower the pump during the purging process until the pump is within the screened section, when purging will be complete).

4. If the well purges dry, the water should be allowed to recover 90% of the pre-purge water level (or for two hours, whichever occurs first) prior to sampling;
5. In the case of sampling from domestic, industrial or public supply wells where a pump is permanently fixed within the well, the well should be pumped long enough to flush any pipework. If well construction details are available, the well should be purged of three well volumes. If this information is not available, the well should be pumped for approx. 15 minutes prior to sampling or until pH, temperature and specific conductivity stabilise. Care should be taken to adjust the pumping rate if necessary to avoid pumping the well dry^{*2}.

(*²Pumping a well dry would lead to aeration of the well, resulting in volatile loss or change in the chemical characteristics of the aquifer nearest to the well. This will prevent a representative sample being collected).

2.5 Sample Collection

Groundwater samples should be collected immediately on completion of purging, unless significant drawdown has occurred in which case the well should be allowed to recover. Sampling must be undertaken within 24 hours of purging to ensure a representative sample is obtained.

All samples are collected using a dedicated bailer, which can be either Teflon or polyethylene (or stainless steel).

2.5.1 Sampling Procedure

The following procedure should be followed during sample collection (following purging): -

1. Lower bailer into well using nylon cord. Nylon cord should be knotted or marked in meter lengths and the bailer should be lowered to the mid point of the screened well section. Care should be taken to minimise agitation and exposure to the atmosphere;
2. Dispose of water from the first two bailers;

3. When sampling for volatiles take from the third bailer (ensure volatiles are placed in 60ml water vials with Teflon lid);
4. Sample for other determinants thereafter (ensure use of appropriate sample containers);
5. Record date and time of sample collection, the collection method, parameters to be analysed, the number and type of sample containers and any other information that may be relevant to interpretation;
6. Ensure all sample bottles are correctly labelled with the site reference number and borehole location;
7. All samples submitted to the laboratory must be accompanied by the laboratories chain of custody form.

3.0 RECORD FORMS

| Sample Collection Form | | Sheet ...1... of1 | |
