Subject: FW: Hafod fly monitoring reports

FYI, Entomologist report for a fly complaint at Hafod.

The most numerous flies on the Bangor Road trap were Anthomyiidae, with 20 present. These smallish, grey flies are usually associated with live or decaying plant material (some species, such as cabbage root fly, are recognised pests) and are very common in the environment. We often catch these on landfill site traps but the flies have no particular association with waste handling. There were also a single bluebottle (carnivorous as larvae and attracted to carrion), one yellow cluster fly (a parasite of earthworms that overwinters as the adult in unheated buildings), one *Melinda* spp. (internal parasite of snails as larvae), 2 hoverflies (predators of aphids), one Sarcophagid (flesh fly – carrion feeder), one crane fly (or daddy longlegs, feeds on plant roots as the larva) and one Dolichopodid, a flattened, metallic fly that is a predator of other flies and is often found near water. Nothing else of any size was found.

None of the above are particularly associated with waste handling and none are normally found indoors, though bluebottles will enter houses to lay eggs if they detect meat (e.g. pet food) inside. There were no common house flies on your landfill site traps and none on the Bangor Road trap, so I would say that you have good evidence that you are not causing a problem.

I hope this helps.
regards,
Mike

Thanks Mike

One of the traps was marked Bangor Road and had some flies from a complainants house. I should have mentioned this before sending, so apologies. Is there any chance you can identify the flies on that board and let us know if they are waste related species.

Kind regards
