Date: 2<sup>nd</sup> October 2015

Dear Mr Zachary,

A review of the site SPMP has been carried out. A significant quantity of data has been collected since 2004 by both Synthite and TS Resins. Based on this data and the fact that both companies have the same parent, the following changes have been made:

- A common SPMP has been created for the site.
- The SPMP will be audited every four years.
- Metals, non-metals, oils etc. will be tested every four years by off-site laboratories.
- Methanol, formaldehyde, phenol and nitrogen will be tested in-house every six months.
- Boreholes have been assigned different analysis suites depending on the likelihood of the four above species being present in that area.
- Should there be a significant increase in any of the species, additional testing will be carried out.

We believe the most likely emissions to ground are methanol, formaldehyde, phenol and nitrogen bearing species (urea, melamine, amines). On that basis, the above analysis philosophy will cover likely emissions and indicate if there is a problem on site.

As both companies are owned by the same parent and data is being freely shared between them, it follows that a common SPMP is best practice.

The companies are aligning audits due under their permits. In 2015 the SPMP has been audited as well as water use. A four year cycle has been implemented to ensure all audits are carried out in line with permit requirements.

Yours sincerely,

Greg Hickman
