## LIBERTY STEEL NEWPORT LIMITED

---

Permit Number:	EPR/EP3830GH
Company:	Liberty Steel Newport Limited
Permit Condition:	4.2.2 (a) A report or reports on the performance of the activities over the previous year shall be submitted to Natural Resources Wales.  The report shall include as a minimum: <ul style="list-style-type: none"><li>- A review of the results of the monitoring and assessment carried out in accordance with the permit including an interpretive view on data.</li></ul>

---

### ***Report on year 2018***

#### ***Overview***

Of the main activities provided for within the Company's Environmental Permit, only the Hot Strip Mill (Activity Ref A1) and the associated Reheating Furnace (Activity Ref A2) were operated during the year 2018. Whilst capacity remains unchanged, activity levels were seen to remain at to approximately 50% of those anticipated; throughput increasing marginally from the 208,332mt's achieved in 2017 to 233,437mt's for the year 2018.

The process continued to be operated on an 80 hours/week basis, made up of 4 x 20 hour runs from 20:00 – 16:00 Monday to Thursday. Employee numbers increased slightly from 184 persons (Dec 17) to 187 persons (Dec 18) across the site.

Activities relating to the importing and storage of wastes (Activity Ref 14) and the recycling and reclamation of metals and metal compounds (Activity Ref 15) have been limited to the storage of RDF. Whilst the receipt of RDF was suspended in August 2016 an action plan for the disposal of RDF has subsequently been agreed with the Regulator. A total of 6,667 mt's was removed from site and disposed of appropriately during the reporting period. This was removed to the Tregatti landfill, Merthyr Tydfil (EPR RP3733PC) under an appropriate waste transfer process (See Appendix 1)

Of these aspects, those likely to have an impact on the environment remain:

*i. The Process*

The purpose of the process is to convert steel slabs into Hot Rolled Coils via a 300mt/hr single fuel natural gas fired reheat furnace and six stand finishing mill. Steel slabs are typically imported across the company's private berth on the R. Usk This process remained unchanged during the reporting year albeit only operating for 38 weeks of the 48 production weeks available. Given this significant non operational period, the potential for the adverse impact on the environment, particularly through the release of fugitive emissions, was greatly reduced.

Liberty Steel Newport Ltd (LSN) remains committed to monitoring environmental performance by recording a number of Key Performance Indicators and comparing these with previous years (See Appendix 2) Additionally LSN has, as part of its Environmental Management System, identified certain parameters with a view to targeting reductions of 10% on the previous year (See Appendix 3) Having continued to recover from a temporary cessation in activities since production resumed in October 2015 the benefits of comparison against previous year data is limited however it is advocated that this will continue to be a useful method of benchmarking going forward.

*ii. Raw Materials Handling*

Raw materials are limited in the main to steel slabs which are imported directly across LSN's private berth on the R Usk. LSN continues to operate the berth in accordance with a Port Facility Waste Management Plan, approved by the Maritime & Coastguard Agency, which makes provision for each vessel visiting the berth to advise upon wastes likely to be disposed and in turn feedback on the suitability of facilities provided.

Additionally all dunnage used in the packaging of delivered product is appropriately debarked, heat treated, and marked prior to receipt in compliance with ISPM15 standards. All stored dunnage continues to be spot checked by Forestry Commission representatives on a 3 – 6 monthly basis. There have been no issues arising during the reporting year.

The potential for fugitive emissions arising in this area is limited to activities where mobile plant is utilised. LSN has now procured all mobile plant used on site and has responsibility for all subsequent testing and maintenance. Vehicles continue to be maintained to a state of operational readiness.

*iii. Reheat Furnace*

Stack monitoring continues to be undertaken at appropriate quarterly intervals (Permit Condition S4.1). Processes relating to emission points A1 to A4 have remained offline during the reporting year and hence no monitoring has been undertaken therefore all monitoring of emissions to air relates to emission point A5. Permit requirements remain;

<i>Parameter</i>	<i>Reporting Period</i>	<i>Limit</i>
Oxides of Nitrogen	3 Monthly	400 mg/m <sup>3</sup>

LSN can report that the maximum measurements obtained during all quarterly monitoring regimes remain below 203 mg/m<sup>3</sup> significantly within reporting parameters. Trend results of all quarterly monitoring undertaken since Q1 2016 are provided in graphic form (Appendix 4)

For the purpose of benchmarking releases to air, monitoring has been extended to include metals deemed to be appropriate to the current process. These are identified as KPI's within the Company's EMS and are compared annually with those of the previous year (Appendix 2) with results against targeted reductions being favourable for the reporting period.

*iv. Roughing Mill and Finishing Mills*

VOC's may be generated as a result of transient hydraulic and lubricating oils lost to process water during scale removal (Activity Reference A11) The main area presenting a risk of oils entering the closed water system is at the 12 back up roll oil seals. A robust maintenance programme is in operation to reduce the risk of seal failure and in turn contamination of process water. The effectiveness of such a programme is monitored by measuring oil content of mill scale on an ongoing basis. Additionally oil is recovered from these closed systems and recycled for further use. The effectiveness of such a programme can be demonstrated in the oil usage levels recorded annually which again are targeted in the company's EMS (Appendix 3)

*v. Cooling Section and Cooling System.*

During normal operations cooling water is retained in two closed water systems each of 60,000m<sup>3</sup> which can be operated in separation or in tandem. Losses from these systems are limited to evaporation and depending on seasonal variations can be as high as 5,000m<sup>3</sup> per operational day.

Recognising the need to use resources efficiently LSN has in May 2018 established a reliable source of grey water which has negated the need to use towns' water in the process. The supply of both potable and non-potable water volumes are recorded on fiscal meters. The UK experienced its driest summer since modern records began in 1961 - 50.8mm of rain fell between 1 June and 19 July 18, lower than the previous record of 58mm in 2013 (Met Office). Records show that site consumption of potable water for the year reduced from 47,188m<sup>3</sup> in 2017 to 35,597m<sup>3</sup> - or by 74ltrs/metric tonne produced (See Appendix 3)

LSN continues to operate a water treatment programme in full compliance with HSG 274 Parts 1 – 3. Significant improvements relating to the control of legionella include;

- i. Pack renewal to all cooling towers (August 2018)
- ii. New risk assessment in line with HSG 274 to reflect alternative water supplies

*vi. Surface Water*

Site run off continues to be undertaken at monthly intervals by spot sampling (Permit Condition S3.2) and reported on a quarterly basis to the regulator. A twelve monthly review of results are provided in graphic form (Appendix 5)

Mass releases to water per kg are calculated at year end. These are identified as KPI's within the Company's EMS and are compared annually with those of the previous year ([Appendix 2](#)) targeted reductions being favourable for the reporting period.

#### *General Waste*

The potential for fugitive emissions arising from the storage of wastes on site has increased relative to the number of personnel on site and the level of activity. This is reflected in the report on annual KPI's ([Appendix 2](#)) Disposal streams are in place to manage waste in an appropriate manner. These are also reported annually via the Pollution Release and Transfer Register (PRTR) and National Atmospheric Emission Inventory (NAEI) reporting system.

R STEED
