# Colomendy Waste Transfer Station Noise and Vibration Management Plan

Report for Denbighshire County Council

WRAP's vision is a world in which resources are used sustainably.

Our mission is to accelerate the move to a sustainable resource-efficient economy through re-inventing how we design, produce and sell products; re-thinking how we use and consume products; and re-defining what is possible through re-use and recycling.

## 1.0 Introduction

This noise management plan (NMP) has been compiled for Denbighshire County Council's (DCC) Colomendy waste transfer station (WTS) 'the site'. This document, which will form part of the site's management system, has been produced in accordance with Natural Resources Wales' (NRW) guidance on 'How to Comply with your Environment Permit'<sup>1</sup>, 'Noise and vibration management – environmental permits'<sup>2</sup> and to supplement the site's Environment Risk Assessment.

The objective of this plan is to identify and minimise the risks of noise and vibration from the site activities and to describe the appropriate measures that are in place to prevent or, where that is not practicable, to minimise the presence of noise which is likely to cause pollution, hazard or annoyance outside the boundary of the site.

Other aspects that this NMP will cover include:

- Monitoring;
- Actions plans in the event of noise nuisance;
- Allocation of responsibilities; and
- Review schedule for assessing effectiveness of the measures within this plan.

## 2.0 Site Background

### 2.1 Introduction

The site is operated by DCC, who are the permit holder. The site operates as a waste transfer station and depot, accepting a range of material streams from local residents and from small commercial waste operators for processing (sorting and baling), as well as highways material. The site is permitted to accept up to 55,000 tonnes of material per year.

### 2.2 Site Setting

The WTS is situated on Colomendy industrial estate located off the Ffordd Y Graig Road in Denbigh. The site is on an industrial estate situated between farmland to the north and east, commercial premises to the south-east and south, and an aggregate quarry to the west. Beyond the commercial premise to the south and southeast, there are residential properties within 1km, whilst to the west (and within 1km), woodland surrounds the quarry, including two Sites of Special Scientific Interest (SSSI) within 2km.

### 2.3 Site Layout

The layout of the site is shown in Figure 2-1.

### 2.4 Operating Times

The site operating times are:

- Monday - Saturday 06:00 - 19:00
- Sunday 09:00 - 16:00

No operations take place on Christmas and New Year's Day.

The working area of the site has impermeable surfacing and is accessed via a gate to the south west of site, from Graig Road. The site comprises of:

- The main waste transfer building, containing:
  - Bays for residual waste, paper, absorbent hygiene products (AHP) container, cardboard, mixed metals and plastics and sorted metals and plastics;
  - A sorting line;
  - Two balers; and
  - Office and welfare facilities.
- External sheds containing:
  - Gully waste, recyclable highways waste and green waste bays;
  - Food waste sealed skip area;
  - Vehicle wash; and
  - Bale storage.
- In addition to the waste mentioned above, there are external bays for glass, spare materials, fly-tipped waste, topsoil, non-recyclable highways waste, road sweepings, containers for textiles, Waste Electrical and Electronic Equipment (WEEE), batteries and aerosols and a dedicated quarantine bay.
- The site has two weighbridges.
- There is parking for waste fleet vehicles and separate staff parking.
- To the north of the site is a firewater supply tank.

## 2.5 Waste Activities

Activities that take place on site include:

- Unloading and unloading of waste material;
- Sorting;
- Baling; and
- Storage.

Waste operation name	Description of the waste operation	Annex I or Annex II (disposal and recovery) codes
Colomendy Waste Transfer Station	Transfer of waste: household commercial and industrial	<b>R3:</b> Recycling/reclamation of organic substances which are not used as solvents <b>R4:</b> Recycling/reclamation of metals and metal compounds <b>R5:</b> Recycling/reclamation of other inorganic materials <b>R13:</b> Storage of wastes pending any of the operations numbered R1 to R12 (excluding temporary storage, pending collection, on the site where it is produced)
	Transfer of waste: hazardous	<b>D9:</b> Physico-chemical treatment not specified elsewhere in Annex II which results in final compounds or mixtures which are discarded by means of any of the operations numbered D1 to D8 and D10 to D12 <b>D14:</b> Repackaging prior to submission to any of the operations D1 to 13 <b>D15:</b> Storage pending any of the operations numbered D1 to D14 (excluding temporary storage, pending collection, on the site where it is produced)

### **3.0 Sensitive Receptors**

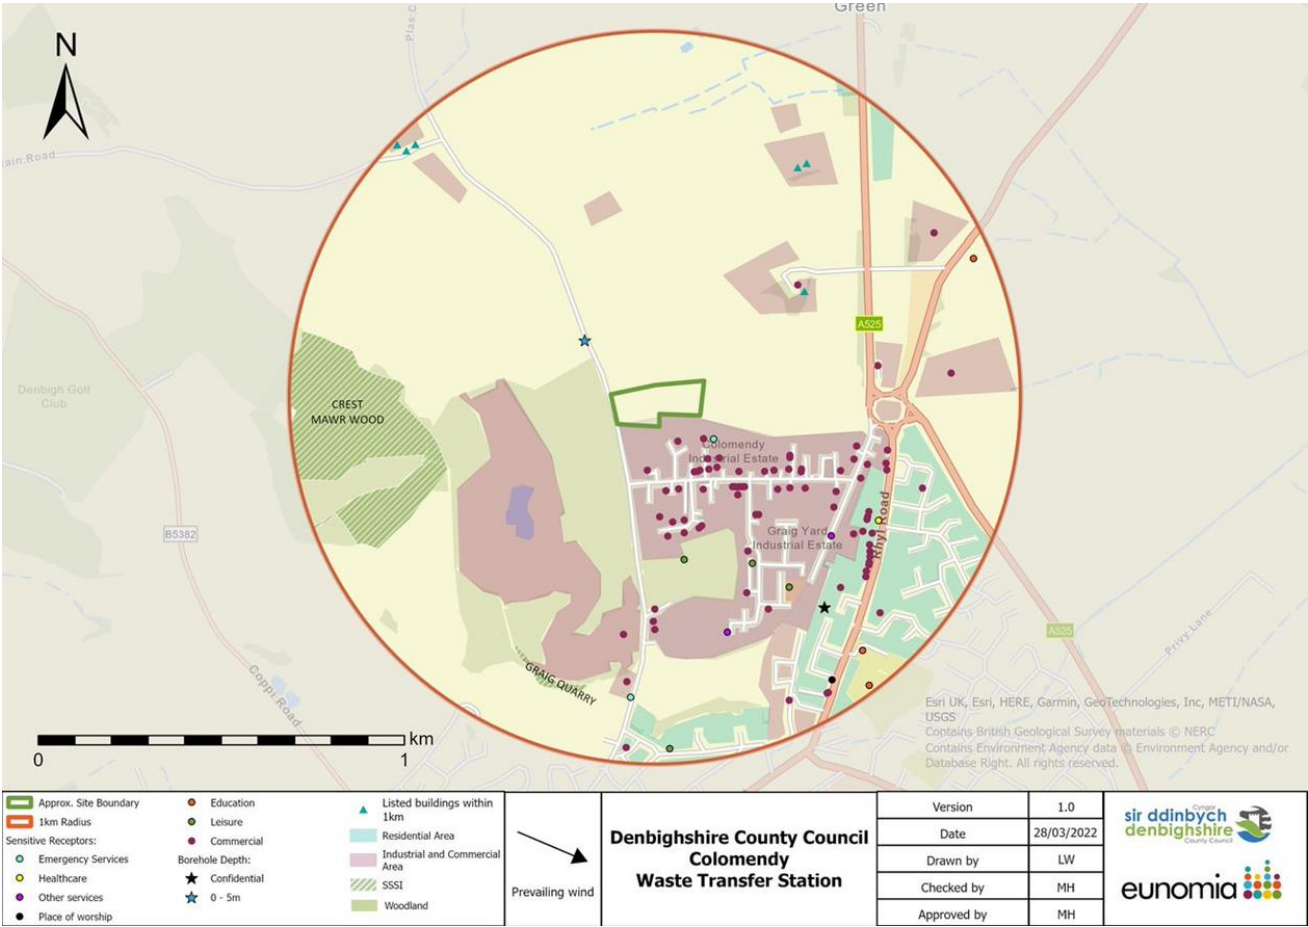

A map of the sensitive receptors within 1km of the site is detailed in Figure 3-1. The sensitive receptors that are most likely to be affected by a noise emission incident have been identified. These receptors may need to be contacted during an incident with updates on the expected duration. The contact details for these receptors can be found in Appendix 7.1.

In the event of a significant noise emission incident, DCC will use its website and social media channels to communicate information with sensitive receptors throughout the borough. DCC officers may also visit adjacent or high risk sensitive receptors to deliver the message in person.

The potential impact on these receptors is also assessed within the separate Environmental Risk Assessment which forms part of the site's management system.

Figure 3-1: Surrounding Land-use and Sensitive Receptors within 1km of the Site<sup>3</sup>

<sup>3</sup> There are no other SSSIs within 2km other than those shown in this 1km boundary

## 4.0 Potential Noise Sources

Noise impact assessments were carried out at the nearest sensitive receptors to the site using appropriate measurement equipment, to the standards defined by BS 4142 at both the planning and permitting stages. Based on these noise impact assessments, operation from the development is likely to have a low impact during the operational daytime periods at the nearest noise sensitive receptors. The site is based in an industrial area and the noise generated by Colomendy WTS would not be a new type of noise source for the surrounding receptors.

It is therefore not anticipated that noise levels would be excessive or a cause for pollution or nuisance under normal conditions, with appropriate measures in place.

Copies of the noise impact assessments can be found in the site's management system.

### 4.1 Identification of Sources

Sources of noise at site include:

- Plant and machinery;
- Site transport; and
- Waste material acceptance.

### 4.2 Preventative and Control Measures - Normal Conditions

Appropriate measures will be taken in order to minimise the noise emissions from the site, following the hierarchy as defined in the EA/NRW's 'Noise and Vibration management:

Environmental Permits' guidance:

- **Prevent** the generation of noise;
- **Minimise** or contain noise at source;
- Use **effective silencers**, barriers or enclosures;
- Use **sympathetic timing** for unavoidably noisy operations; and
- Increase the **distance** between the source and the receptors.

#### 4.2.1 Plant and Machinery

All plant and machinery sourced will be appropriately designed, well-maintained and subject to a maintenance/ servicing schedule to prevent noise arising from malfunction. Daily pre-use inspections are to be carried out on all plant and machinery and any faults or issues found are to be reported to the site manager. Records of these daily inspections and the scheduled maintenance will be kept in the site office.

Fixed plant on site includes the baler and sorting line. These are situated within the main building. When operational, roller shutter doors to the building will be closed to reduce the noise levels audible from outside the building. The doors will only be opened to allow vehicle access. This will be intermittent throughout the working day for short periods of time, estimated in the noise impact assessments to be ~1 minute per hour. The plant will only be operated during the site's opening times, as defined in the site's Operating Techniques.

All plant and machinery will be switched off when not in use, to prevent unnecessary noise.

#### 4.2.2 Site Transport

Speed limits of 10 mph will be implemented for vehicles using the site. Drivers are instructed on arrival at site to keep engine revving to a minimum. Horns will be used when entering the

buildings and turning corners for safety reasons and only within operational hours. Vehicles will be switched off when not in use.

#### *4.2.3 Waste Material Acceptance*

Some wastes can be noisy to load or unload. At the site, glass waste is the only waste subject to additional health and safety controls for tipping, due to the noise levels emitted. Glass will be tipped in an external bay to prevent excessive noise impact to operatives working within the building. As will all the external bays, the glass bay has 5m high concrete walls to act as a noise barrier and acoustic cladding panels. The specification for these walls can be found in Appendix 7.2.

Noise from the loading and unloading of glass will be intermittent throughout the working day. Glass collections occur twice weekly and take about 30 minutes. The glass bay is located away from the most sensitive receptors to further minimise disruption. Material will only be tipped in or loaded from this bay during operating hours.

There is also an extension to the northern wall (bringing it to 7m total) to mitigate any noise spread from the buildings to the north of the site.

### **4.3 Preventative and Control Measures - Abnormal Conditions**

#### *4.3.1 General Procedure*

In the event that significant noise is observed on site, or in the event that significant levels of noise are observed outside the site boundary, action will be taken. The source of the noise will be identified and depending on the severity of the noise, the noisy activity will either be reduced, altered or stopped until circumstances have changed, or other appropriate measures have been put in place (e.g. erecting noise screens or moving the activity to another area of the site).

Abnormal conditions that may arise include:

- Machinery breakdown;
- Planned or unplanned maintenance;
- Weather conditions; and
- An incident on site.

#### *4.3.2 Machinery Breakdown*

All plant and machinery sourced will be appropriately designed, well-maintained and subject to a maintenance and servicing schedule to prevent noise arising from malfunctioning plant or machinery. Should an item of machinery breakdown, the machinery will be switched off, isolated and corrective action taken. The machinery will not be used until repairs have been carried out. This will be within 72 hours under normal circumstances. If the plant cannot be repaired within this timeframe, additional plant may be hired to cover. Depending on the nature of the fault, the item of plant or machinery may be replaced or subject to increased maintenance or servicing to prevent reoccurrence.

#### *4.3.3 Planned or Unplanned Maintenance*

In the event of any temporary noisy works scheduled at site, e.g. site maintenance, the nearest sensitive receptors will be notified as to the nature and expected duration of the work and reasonable steps will be taken to reduce the impact of the noise, such as enforcing restricted hours of maintenance, if appropriate, or installing noise barriers.

#### *4.3.4 Weather Conditions*

The site buildings and mobile plant will have adequate ventilation systems to prevent the need to open sound-proofing windows or doors in hot weather.

#### 4.3.5 Other Incidents

Should an incident occur on site that is likely to cause noise pollution, e.g. a fire or a break-in that triggers an alarm, the sensitive receptors will be notified of the cause and expected duration, if appropriate, following the procedures in the site management system and Operating Techniques.

## 5.0 Monitoring and Responsibilities

Noise monitoring will be undertaken:

- in line with preventative measures;
- in order to assess how successful the operational management and mitigating control measures are at the facility;
- to identify whether noise is causing a potential nuisance; and
- to ensure that appropriate remediation measures are adopted early.

Monitoring will be undertaken by trained, designated staff. All depot staff will be trained on all procedures in the NMP. This will form part of their training matrix. Depot staff will take turns in undertaking the daily checks.

All site personnel will be responsible for reporting any problem noise identified during their day to day operations and for carrying out the procedures in Section 4.0.

Parameter	Monitoring Technique	Frequency	Responsibility
Subjective Noise Monitoring	Site perimeter and off site checks (along the site perimeter).  In line with EA/NRW guidance: 'Noise and vibration management – environmental permits'	During normal operating conditions: <ul style="list-style-type: none"><li>• Daily</li></ul> During an incident or abnormal operating conditions: <ul style="list-style-type: none"><li>• Frequency of monitoring will be increased until incident is resolved</li></ul>	Trained, designated staff members.
Complaints Monitoring	Logged and actioned as in Section 6.0	<ul style="list-style-type: none"><li>• Ad-Hoc/ following incidents.</li></ul>	Site manager
Review the effectiveness of the NMP	This NMP will be reviewed for effectiveness and continuous improvement.	In lieu of no complaints: <ul style="list-style-type: none"><li>• Annually</li></ul> After a complaint that was substantiated: <ul style="list-style-type: none"><li>• Immediately following a complaint at the Facility.</li></ul>	Site manager

The site manager is responsible for periodically reviewing the NMP and updating this procedure with any changes required or following a significant odour emission incident.

To maintain continuous improvement, as part of the annual review of the NMP - or sooner, if a review is prompted by an incident - all complaints and incidents will be reviewed and operations, infrastructure and training needs will be revised in line with these, with the aim of improving operations on site.

### 5.1 Auditory Monitoring

As part of the daily inspections, appropriately trained and experienced site personnel will carry out subjective auditory monitoring around the site. The monitoring results will be

recorded on the site daily inspection sheet and site diary, which forms part of the site's management system.

During normal operating conditions noise monitoring will take place daily. This will be at various times during the day to avoid bias from regularly monitoring at the same time (e.g. always monitoring outside of the loading/unloading window).

During abnormal operating conditions noise monitoring will take place at least twice a day. The frequency of monitoring can be further increased until the incident is resolved or in case of a noise complaint.

Noise monitoring will be carried out in accordance with the recommendations detailed in the guidance 'Noise and vibration management – environmental permits'.

Any instances of noise being perceived to be above acceptable levels, either during the daily subjective noise monitoring or at any other time, will be reported to site management. The site manager will take action to find the source of the noise and mitigate it as appropriate using the procedures in section 4.3.

If required, specialist noise monitoring or mitigation advice will be sought by a qualified third party contractor.

Daily checks will be kept on record for 3 years, the site diary will also be updated with any issues and kept for three years.

## **6.0 Complaints**

In the event of a noise complaint, investigations will commence immediately to identify the source of the noise. These investigations will be carried out by the site manager and will:

- ensure noise management procedures are in place for the source noise;
- check if noise management procedures have failed; and
- note the impact of the noise emissions.

Should the investigation identify that remedial action be taken, the procedure in Section 4.3 will be followed.

A record of the complaint and investigation will also be made in DCCs corporate customer service software, that demands a response and follow up to complaints. Complaints are to be responded to within 10 working days. Investigations are carried out and appropriate measures put in place to prevent reoccurrence, and reviewed with the aim of improving operations on site.

Details of complaints, investigations and actions will be made available to NRW on request.

Information will be provided to the local neighbours regarding the point and method of contact for the site in the event of a complaint or if they want to discuss any activities at the site.

- The neighbours can be advised that any complaints or concerns will be addressed immediately following identification and notification, and contingency action implemented;
- The neighbours can be advised of any corrective action and a follow up call carried out if required.

The primary point of contact at the site for complaints and liaison with the neighbours is the site manager who will ensure that the recording, investigation and close out of complaints is undertaken as described above and in accordance with company management procedures.

## 7.0 APPENDICES

### 7.1 List of Sensitive Receptors

## 7.2 Firewall Specifications

The advertisement features a background image of an airport tarmac with a large aircraft and a yellow directional arrow on the ground. A white wireframe diagram of a precast concrete firewall structure is overlaid on the right side of the image. The JP Concrete logo, consisting of a stylized orange 'J' and 'P', is positioned above the company name. The text 'DESIGN | SUPPLY | INSTALL' is in smaller orange letters below the company name. The main headline 'PRESTRESSED CONCRETE PANELS' is in large white letters. The website 'www.jpconcrete.co.uk' is at the bottom left. Three service boxes are at the bottom: 'Expert advice' (orange), 'Quality Assured' (dark blue), and 'Precast solutions' (teal).

**JP Concrete**

**Expert advice**  
Our product specialists will advise on the most cost-effective precast solution for your project.

**Quality Assured**  
We are proud to hold ISO: 9001, 14001 & 18001 Constructionline Silver Membership &SSIP

**Precast solutions**  
Our skilled teams of engineers, groundworkers & precast installers cover the entire project life-cycle.

# PRESTRESSED CONCRETE PANELS

Prestressed Concrete Panels are a versatile product which can be used to store wide variety of materials.

- ✓ Panel Thicknesses 100mm to 280mm
- ✓ Custom Lengths up to 7m
- ✓ 20kN/m2 Surcharge Capacity
- ✓ C60 Concrete Mix Strength
- ✓ Installation Service Available

## Features

Corner angles can be supplied to create bays of any height with ease.

Horizontal and vertical joints between the precast elements can be sealed, enabling these products to be used for the storage of liquids.

Wall units are manufactured under factory-controlled conditions, designed to relevant British Standards and are CE marked.

The prestressed concrete panels are suitable for a wide range of applications including:

- Fire & Blast Walls
- Flood Defence Walls
- Grain Walling
- Storage Bays
- Dairy & Livestock Buildings
- Silage Clamps
- Bund Walling

We provide a full design, construction & installation service for all of our products, enabling us to offer turnkey solutions. Call the team today to discuss your project. 01158 220 282

# PRODUCT SPECIFICATIONS

Below is a table outlining the characteristics of the prestressed concrete panels.

Here you can find information on concrete strength, material density and surcharge capacity.

Wall units are manufactured under factory control, have been designed to relevant British (BS) standards and are CE marked.

If you require any further details please contact us and one of our product experts will be happy to provide more information.

Concrete Strength	C60	Material Density	18	Surcharge Capacity	20*	Design Life	100*
Compressive strength of concrete after 28 days of curing.		Maximum material density of retained material, measured in kN/m <sup>3</sup>		Maximum surcharge capacity of precast element, measured in kN/m <sup>2</sup>		Number of years precast element has been designed for.	
Connection		Edge Detail		Concrete Finish	A*	Fire Resistance	180*
Precast elements interlock with tongue and groove edges.		Chamfered edges create softer sight lines & reduce damage during installation		Smooth mould finish Type A to precast element, defined in British Standards		Number of minutes precast element would provide fire resistance.	
Reinforcement Cover	25	Tolerances	6	Foundation Type	N/A	Retained Face	DL
Minimum cover to steel reinforcement in precast element, measured in mm.		Typical manufacturing tolerances & dimensional variations +/- in mm.		Panels fixed to steel columns, no additional foundation required.		Double Load - Precast element is suitable for retaining material on both faces	

\* These are the maximum values that can be achieved with concrete panels, this will vary depending on the panel thickness & panel length. Concrete panel finish is class A to the front face and hand trowel finish to the back face.

# PRODUCT RANGE

There are four standard width options and three height options. Non-standard heights can be manufactured from 500mm to 1500mm.

Installation of the concrete panels is quick and easy, the elements can either be positioned into the web of a steel column, or clipped to the outside face. The panels require a steel at each end to attach to, so ideal for using in portal frame building. The panels sit directly on top of the pad foundations and no additional support is required under the panels.

**100mm**

Width	<b>100mm</b>
Length	<b>1000mm – 6500mm</b>
