0.0 FOREWORD

The following Conditions and Notes on Site Investigation Procedures should be read in conjunction with this report.

0.1 General

Recommendations made and opinions expressed in the report are based on the strata observed in the excavations, together with the results of site and laboratory tests. No responsibility can be held for conditions which have not been revealed by the Exploratory Holes or which occur between Exploratory Holes. Whilst the report may suggest the likely configuration of strata, both between Exploratory Holes and below the maximum depth of investigation, this is only indicative, and liability cannot be accepted for its accuracy.

Unless specifically stated, no account has been taken of possible subsidence due to mineral extraction below or close to the site.

0.2 Investigation Procedures

Cable Percussive (CP) and Sonic Drilled Boreholes and Trial Pitting techniques for ground investigation have been employed within the project. All Exploratory Hole operations, sampling and logging of soils, and in-situ testing complies with the recommendations of the British Code of Practice BS 5930: 2015 'Site Investigations', British Code of Practice BS 10175: A2:2017 'Investigation of Potentially Contaminated Sites' and BS 1377: 1990, 'Methods of Test for Soils for Engineering Purposes'.

0.3 Routine Sampling

Representative bulk disturbed and environmental samples of the different strata are taken following completion of logging. These samples are sealed and labelled in clear plastic bags and 2kg plastic tubs. Soil samples obtained for environmental testing are sampled and sealed in borosilicate amber jars or in specialist vessels where required. Ground Water samples were sampled and sealed in borosilicate amber bottles or in specialist vessels where required All samples are returned from site to QGL's laboratory for controlled storage within 24 hours of sampling to await test scheduling/requirements.

0.4 In-Situ Testing, Surveying & Instrumentation

In-situ testing comprised:

- Standard Penetration Testing within Boreholes (SPT)
- Dynamic Cone Penetrometer (TRL DCP)
- Variable Head tests
- All exploratory hole locations to be surveyed for location and elevation.

0.5 Groundwater

Where possible, the depth of entry of any influx of groundwater is recorded during the course of excavation or boring operations. The rate of inflow into the excavation or borehole is monitored during the course of the excavation or during boring procedures. Upon encountering any water strikes, work is temporarily halted and the water levels monitored for a standard twenty-minute period recording the change in water level at the end of the twenty minutes.

Groundwater conditions observed in the excavations are those appertaining to the period of investigation. It should be noted, however, that groundwater levels are subject to diurnal, seasonal and climatic variations and can also be affected by drainage conditions or other causes.

0.6 Retention of Samples

After satisfactory completion of all the scheduled laboratory tests on any sample, the remaining material is discarded. Further to notifying the Engineer/ Client with one week's notice all soil and/or rock samples not tested will be discarded. 28 days after submission of the approved final report.

1.0 INTRODUCTION

1.1 General

Upon the instructions of J.N. Bentley, the Principal Contractor and Client, and in liaison with the Project Designer, Mott MacDonald, Quantum Geotechnic Limited (QGL) was commissioned to undertake a ground investigation for the proposed improvement works at Garnswllt WWTW.

The site is located at National Grid Reference 262089E, 209879N.

The siteworks were carried out between 27thth February and 3rd March 2023 with additional works scheduled carried out between 4th April and 13th April 2023.

QGL were the appointed Contractor for the works, under order number JNB/SV32/SL/22/0002 issued on 25th November 2022. The works were commissioned in order to establish general ground conditions on the site to allow the design and construction works to proceed.

This report presents a factual account of the fieldwork carried out, includes descriptions of the strata encountered, available groundwater observations, details of in-situ testing undertaken and provides results of subsequent laboratory testing of samples obtained from the investigation.

General notes on the techniques employed by QGL are described in the Foreword together with the limitations inherent in carrying out site investigation work.

1.2 Purpose of Ground Investigation

The purpose of the ground investigation is to characterise the engineering, chemical and hydraulic properties of the ground within the areas of proposed new structures.

2.0 SITE DETAIL

2.1 Site Description

The site is located to the west of the village of Garnswllt, approximately 3.5km south of Ammanford, Carmarthenshire.

The site is an existing Waste Water Treatment Works, close to the eastern bank of the River Loughor. The site is relatively level. There are several treatment tanks with associated buildings and infrastructure across the site with Attenuation ponds to the North of the site.

Access to the site is gained via an access track off Ffordd Ynys Tawelog running south from the village. The site is accessed via a level crossing on the Heart of Wales Railway line. Permission was requested each time vehicles needed to cross by contacting the signalman at Pantyffynnon using the phone provided.

The site has been categorised as "yellow" based on the nature of the site and its historical uses, the category of the site has been defined in accordance with the Guidelines for the Safe Investigation by Drilling of Landfills and Contaminated Land (SISG, 1993).

The general extent of the site is shown in Figure 1 in Appendix I.

2.2 Statutory Service Information

All service information was held by the Client with the relevant plans and information made available to QGL prior to commencement of the intrusive works.

A permit to excavate was issued by QGL for all exploratory holes. Standard QGL procedures for breaking ground were followed and all areas were scanned using a cable avoidance tool. A hand dug trial pit was excavated to 1.2m prior to commencement of drilling where services may be at risk. All hand excavation was undertaken using insulated digging tools.

2.3 Published Geology

Details of the published and inferred geology of the site are summarised as follows:

<u>Made Ground</u>

Made Ground may be present based on the site history.

<u>Superficial Deposits</u>

Alluvium, that may comprise clay, silt, sand and gravel, is mapped overlaying Glacial Till comprising

Glaciofluvial Sand and Gravel deposits.

Bedrock Geology

The solid geology in the area is indicated to be the South Wales Upper Coal Measure typically comprising mudstone, sandstone, siltstone and coal.

3.3 Boreholes

Cable Percussive Boreholes

Three Cable Percussive Boreholes, BH01A, BH02A and BH03, were drilled using a Dando 2000 cable percussion drill rig owned and operated by CJ Associates. Two boreholes, BH01 and BH02 were terminated in the hand pit due to encountering obstructions and were relocated in liaison with the Client (BH01A & BH02A).

Representative bulk disturbed, small disturbed samples and environmental samples were recovered from each Cable Percussive Borehole throughout the boring works for geotechnical and geo-environmental characterisation of the underlying ground conditions.

Sonic Drilled Boreholes

Four Boreholes, BH-SD01 – BH-SD04 were progressed by Sonic Drilling methods using a DB320 Rubber tracked Rota-Sonic Drill owned and operated by GeoSonic Drilling.

A sonic drill head works by emitting high frequency resonant vibrations down the drill string to the drill bit. The borehole is advanced by using a sonic drill bit and core barrel attached to drive rods. Casing is generally used to maintain borehole stability. The core barrel and casing are advanced into the ground by use of thrust, vibration and rotation. The sample is emptied into plastic core bags by vibrating the barrel.

The samples recovered from the Sonic Borehole were logged in accordance with BS5930: 2015 +A2:2010; BS EN ISO 14688-1:2017, BS EN ISO 14688-2:2017 and BS EN 14869-1: 2003 and sub-sampled to satisfy the required sampling regime.

In-situ testing was carried out in all boreholes (see section 3.5.).

The sequence of deposits encountered during the investigation is detailed within the Engineering Geologist's logs presented within Appendix II. The logs highlight the nature of the soils encountered and provide descriptions of the strata revealed at the site. Details of the Boreholes, including final depths in metres below ground level (mbgl) are provided below in Table 2.

3.4 Trial Pits

Three Trial Pits were excavated using a wheeled JCB 3CX 180º excavator supplied and operated QGL's approved sub contractor John Jones Plant and Transport. The exploratory hole positions are shown on the exploratory hole location plan in Appendix I.

This method of investigation allows direct sampling of the near surface deposits for identification purposes, as well as assessment of any salient features and Made Ground or disturbed ground. The trial pits were logged in accordance with BS5930:2015; BS EN ISO 14688-1:2017 and BS EN ISO 14688-2:2017,and supervised at all times by an Engineering Geologist from QGL.

All Trial Pits were backfilled with compacted layers of arisings upon completion. Surface reinstatement was levelled, and existing turf replaced where necessary.

Geotechnical and Environmental samples were taken within the superficial deposits for laboratory testing purposes.

Details of the Trial Pits including final depths in metres below ground level (mbgl) are provided in Table 3.

A complete set of Engineering Geologist's Trail Pit logs are presented within Appendix III.

3.5 In-Situ Testing

3.5.1 Standard Penetration Testing

Standard penetration tests (SPTs) were undertaken within all boreholes, at intervals specified by Mott MacDonald.

This is a dynamic test as described in BS EN ISO 22476-3:2005 + A1:2011. Within fine grained or cohesive soils, the test incorporates a small diameter tube (650mm length, 50mm external diameter and 35mm internal diameter) with a cutting shoe known as the 'split barrel sampler'. The sampler is forced into the soil dynamically using blows from a 63.5kg hammer dropped through 760mm. The sampler is initially advanced 150mm into the soil with seating blows, then the number of blows required to advance the sampler each 75mm increment up to a depth of 300mm is recorded. This cumulative total number of blows over the 300mm test is referred to as the "N" value. For coarse gravels and bedrock the split barrel is replaced by a 60° cone (SPT(C) - Standard Penetration Test (Cone)). SPT/SPT(C) results are detailed within the relevant borehole Logs. The SPT calibration certificate for the SPT hammer used during this investigation is presented in Appendix II.

3.5.2 Dynamic Cone Penetration Testing (TRL DCP's)

A total of 7 No. TRL DCP tests (DCP01-DCP07) were undertaken on site. The TRL approved dynamic cone penetrometer test permits a calculation and derivation of a corresponding California Bearing Ratio (CBR) value to facilitate road pavement design. This method is often used where access to undertake conventional CBR testing is not available.

The DCP test involves the fall of a fixed weight over a fixed height to force a 20mm diameter, 60º cone into the near surface soils. The depth of penetration for varying numbers of blows is recorded and is then converted to a CBR value using well established empirical correlations (Highways Agency, 2008). In general, the tests were undertaken between the existing ground surface and 1.0m below ground level, thus providing a profile of correlated CBR values within the near-surface soils. No water was added to the soils prior to testing, so they were in their natural condition. The correlated CBR values are also shown on the test result sheets in Appendix IV.

3.5.3 Variable Head Tests

Five Variable Head tests were undertaken in accordance with BS EN ISO 22282-2 within boreholes BH01A, BH02A, BH03 and BH-SD01 – BH-SD04. The testing involves filling of the borehole's with clean water, or lowering the water level within the boreholes, and recording the time it takes for the water to drain or rise at set intervals. Table 8 overpage provides information as to which boreholes underwent permeability testing.

The variable head datasets and calculated permeabilities are provided within Appendix V

3.6 Soil Sampling

Disturbed samples of soil were taken in clear sealed plastic bags and white plastic tubs. Environmental samples were taken at various depths as noted on the relevant logs.

The environmental samples were dispatched to Chemtest, Coventry using a daily courier service for storage awaiting testing instructions from the Engineer. Environmental soil samples were taken in amber glass jars, vials and plastic tubs provided by the laboratory to suit the anticipated testing.

Geotechnical samples were returned from site to QGL's laboratory for controlled storage to await test scheduling/requirements. For specific details of laboratory testing see Section 4.0.

3.7 Gas and Groundwater Monitoring

Both single 50mm ID, and double 19mm/50mm ID gas and groundwater standpipes were installed within each of the Boreholes as per Engineer's instructions.

Table 4: *Monitoring Installation Details*

Exploratory Hole ID	Pipe ID	Installation Diameter	Installation Response Zone (mbgl)
BH01A	A	50mm	2.50 – 8.50
BH02A	A	19mm	2.50 – 3.50
	B	50mm	2.50 – 8.50
BH03	A	50mm	2.00 – 8.50
BH-SD01	A	50mm	2.00 – 16.50
BH-SD02	A	50mm	6.00 – 15.50
BH-SD03	A	50mm	3.00 – 12.50
BH-SD04	A	50mm	6.00 – 17.00

Four post fieldwork monitoring sessions have been completed. Water samples from each standpipe were obtained during the post fieldwork monitoring.

Monitoring comprised groundwater and ground gas monitoring. Gas monitoring was undertaken using a GA2000 gas analyser to measure the following:

- Atmospheric pressure
- Flow rates (L/hr)
- Methane
- Carbon Dioxide
- Oxygen
- Carbon Monoxide
- Hydrogen Sulphide

The ground gas/water monitoring results are provided within Appendix VI.

Deviations

In accordance with UKAS Policy on Deviating Samples TPS 63. Chemtest have a procedure to ensure 'upon receipt of each sample a competent laboratory shall assess whether the sample is suitable with regard to the requested test(s)'. This policy and the respective holding times applied, can be supplied upon request.The reason a sample is declared as deviating is detailed below. Where applicable the analysis remains UKAS/MCERTs accredited but the results may be compromised.

The following tests were analysed on samples as received and the results subsequently corrected to a dry weight basis TPH, BTEX, VOCs, SVOCs, PCBs, Phenols

For all other tests the samples were dried at < 37°C prior to analysis
All Asbestos testing is performed at the indicated laboratory
Issue numbers are sequential starting with 1 all subsequent reports are incremented by 1

Sample Deviation Codes

A - Date of sampling not supplied
B - Sample age exceeds stability time (sampling to extraction)
C - Sample not received in appropriate containers
D - Broken Container
E - Insufficient Sample (Applies to LOI in Trommel Fines Only)
