Good afternoon Chris,

Thank you for advising us of these works.

I can confirm that Trinity House has no objections or concerns.

Kind regards,

Catherine Bransby

Hello,

As per phone conversation please see below email regarding the Newgale beach works.

Thank you for your help.

Subject: Marine Licence application

Good morning,

I am after some help please, we are currently in the process of applying for a band 1 low risk works marine permit from the Natural Resource Wales to carry out an investigative bore hole on Newgale beach, Pembrokeshire, Wales. This is purely to investigate the geology of the beach for a feasibility survey ahead of the proposed subsea fibre optic cable landing that is due in the future.

What I need as part of the process for NRW is for Trinity House to respond in an email to confirm that this isn't going to have an impact on the safety of others at sea.

I have already gained approval from the MCA and the Local Archaeological Trust and Royal Commission on the Ancient and Historical Monuments of Wales.

Please see attached the location and the method statement for the works and below a description of the works.

Regarding specifics

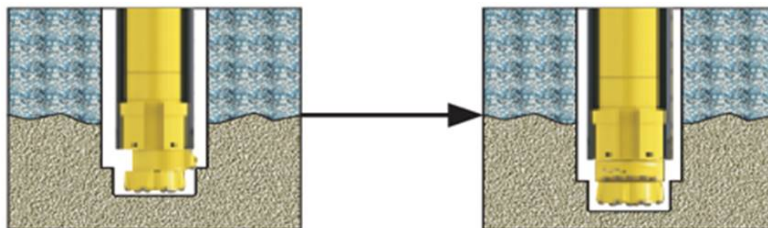

- Contract tractor and trailer to haul rig and support plant across beach from the north access point approx. 400m away from the drill site at the north end of the beach.
- Plant not to be turned off at any point throughout the day.
- BRM to keep an observation on the tide, once on the way in it plant to be demobilised.
- Casing of overburden as follows

An Odex driver is a three-piece assembly including a pilot bit, reamer, and guide device.

When drilling begins, the Odex driver is rotated clockwise which causes the Odex driver to rotate eccentrically subsequently drilling an oversized borehole which is wide enough for the thin wall casing to follow behind the reamer.

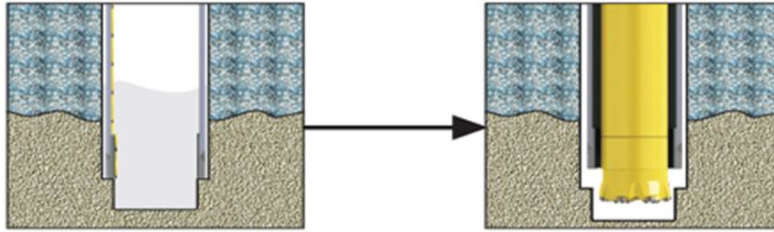

When drilling begins, the shoe (central bit drive ring) is driven to the hole bottom, meanwhile the casing shoe and tube is pushed and pulled down respectively.

When the required depth or competent strata is reached, the Odex driver is reverse rotated which causes the reamer to rotate concentrically allowing the Odex driver to be removed from the borehole with the casing remaining in place

- Open hole drilling as follows

Once in bedrock the casing drivers will be removed, and drilling will continue using a down the hole hammer fitted with a 110 mm ø hammer bit – methodology again detailed below.

Thanks for your help.
