## 1. INTRODUCTION

CFD software used for modeling is StarCCM+ version 10.06 provided by CD ADAPCO company.

Following the CARDIFF furnace CFD modelling [47021103\\_95I003](#), this document presents Temperature site measurement Vs CFD simulation result.

## 2. CHARACTERISTICS OF CARDIFF BOILER

Cases studied are MCR (100%) and low load (60%) to 8000 operating hours whose characteristics are the following:

- **Point DSG :**

LHV (100%) = 10 030 KJ/Kg

Waste mass flow (100%) = 22 960 Kg/h

➔ Qw = heat provided by the wastes = 63.96 MW

- **Point 5 :**

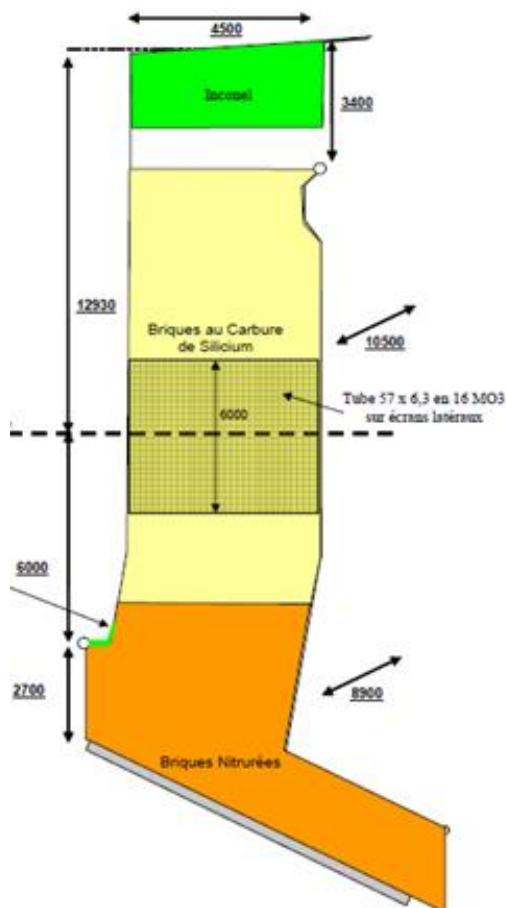

LHV (60%) = 7 000 KJ/Kg

Waste mass flow (60%) = 19 750 Kg/h

➔ Qw = heat provided by the wastes = 38.40 MW

The primary air preheating will be made by a preheating on the steam from the turbine, up to 150°C and by drum steam beyond. Secondary air is also injected at 150°C.

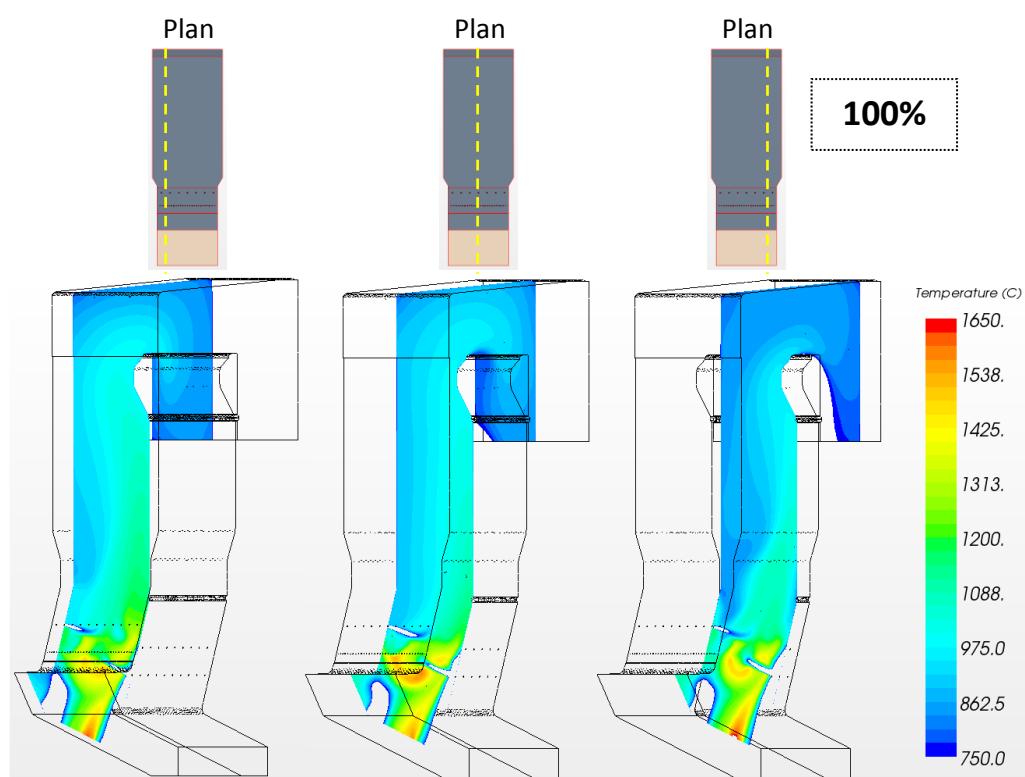

The furnace overall dimensions in the CFD model used are in compliance with the picture below :

### 3. MODEL DESCRIPTION

The CARDIFF model used to check the T2S is the same as CARDIFF furnace CFD modelling presented in [47021103\\_95I003](#).

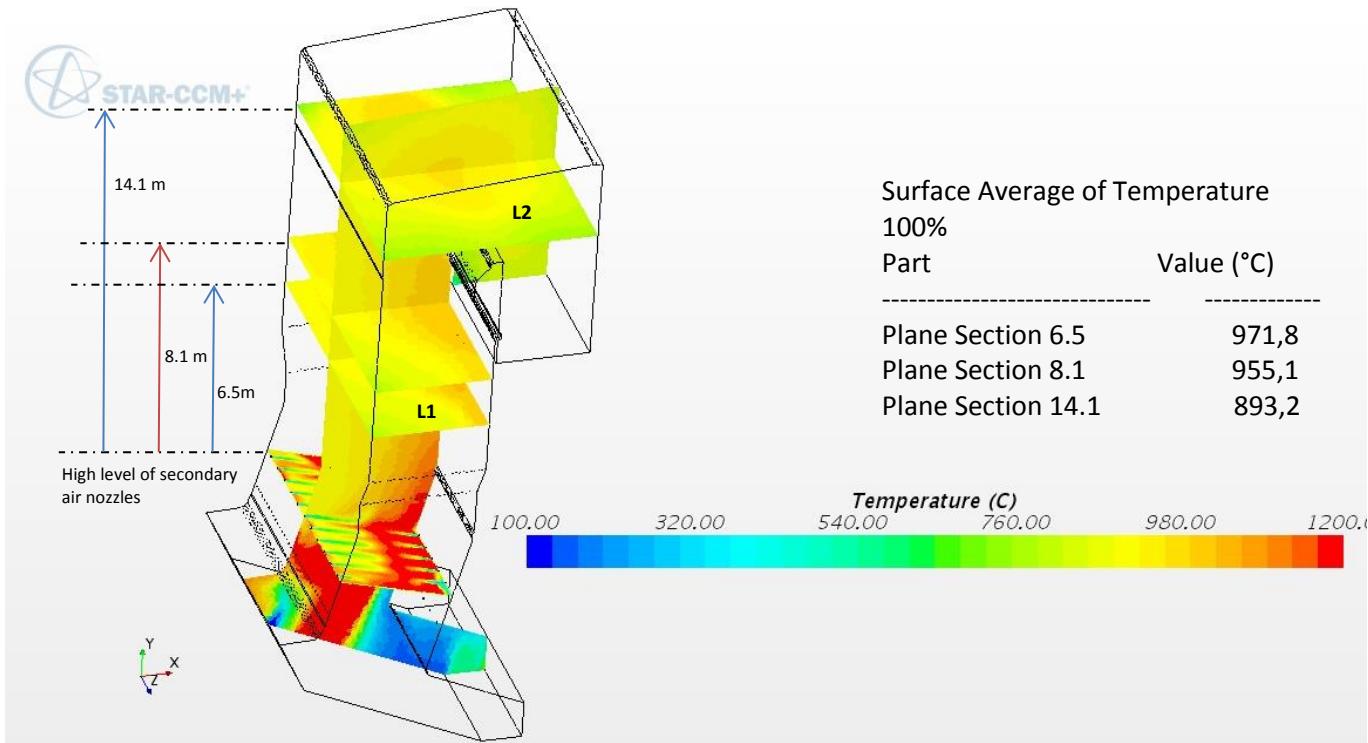

- Geometry for modelling,
- Mesh characteristics (polyhedral, cell size constraint, etc)
- Physical models (turbulence k- $\epsilon$ , radiation, etc),
- Boundaries conditions (mass flow inlet for secondary air nozzles and waste bed, etc)
- Input data (Gaseous stream properties (grate load), secondary air values, etc)
- Load case results (100%, 60%)

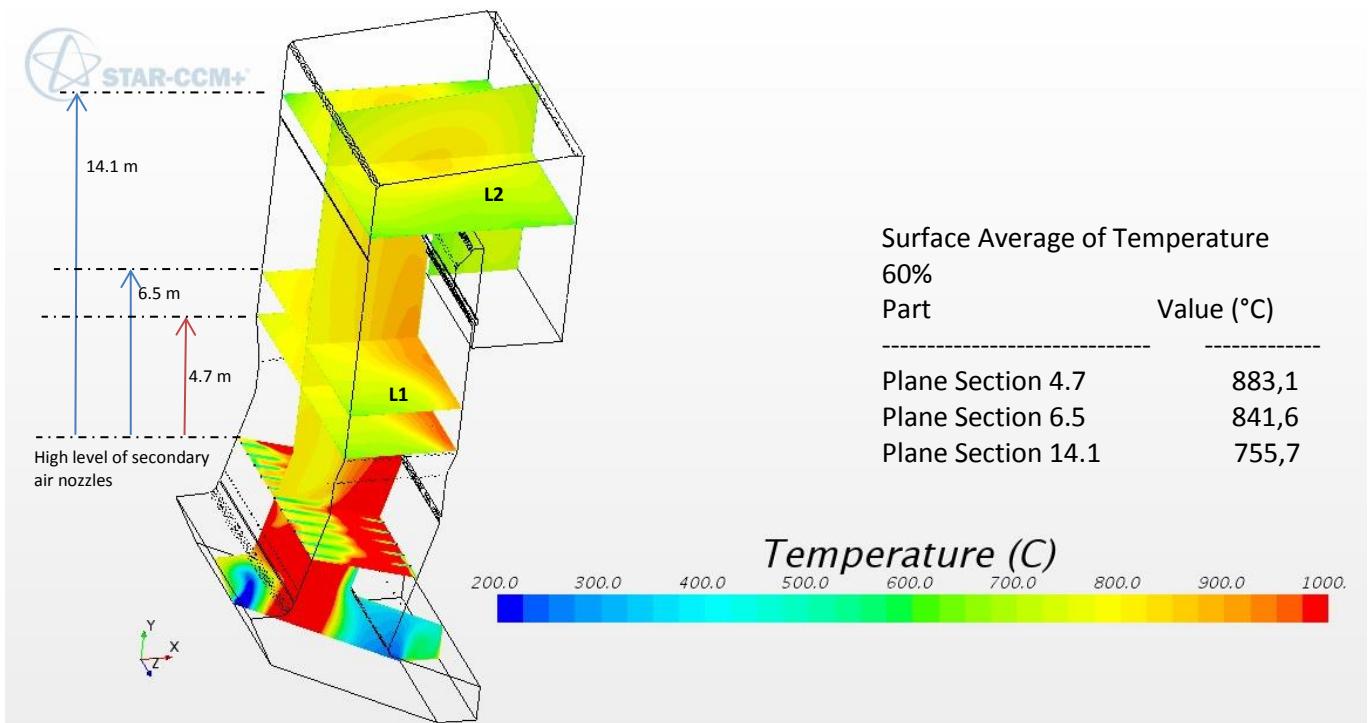

## 4. TEMPERATURE SITE MEASUREMENT VS CFD SIMULATION RESULTS

| Height (m)                         | H2S = 4.7  |  | 6.5  |      | 14.1       |
| side                               |            |  | Left | Left | Left Right |
| Temperature (°C)                   | T2S = 960  |  | 849  | 854  | 837 801    |

#### 4.3. Comparisons

| 100%          |    | CFD | Site measures (average) | Err (%) |
|---------------|----|-----|-------------------------|---------|
| T2S           | °C | 955 | 991                     | 3.6     |
| Lvl 1 (6.5m)  | °C | 972 | 1010                    | 3.8     |
| Lvl 2 (14.1m) | °C | 893 | 920                     | 2.9     |
| 60%           |    |     |                         |         |
| T2S           | °C | 883 | 1001                    | 11.7    |
| Lvl 1 (6.5m)  | °C | 842 | 864                     | 2.5     |
| Lvl 2 (14.1m) | °C | 756 | 834                     | 9.3     |

To conclude, CFD and site measurements are in compliance.

CFD temperatures are generally slightly below the temperature site measurements. This can be explained by the use of perfect average value to compare to mapping method used during test on site.

The part load case considered for CFD calculation is the most stringent with the lowest LHV. In these conditions, compare to the test values, temperature profile will be lower in CFD calculation.
