

**Browns Group Ltd.**  
**Former Morlais Colliery.**  
**Dust Management Plan**

Site Managers / Supervisory staff will be made aware, by training and instruction, of the possibility of dust emissions and the requirement of environmental controls to be applied to deal with any such emissions.

Potential sources of dust releases include those arising from –

- The movement of plant and / or vehicles on site either due to the movement of materials imported into the site or transfer of materials from stockpiles or during loading and unloading of feedstock at the crusher / screen.
- During crushing and screening of materials
- Wind action causing spread of fines from stockpiles.

All or any of the above dust sources will be monitored by regular site inspections and if any dust is noted, treatment by the application of fine water spray on the offending area will be applied immediately.

Treatment water will be sourced either from mains water or by on site bowser.

Any incident requiring application of fine water spray will be noted in the site diary
